Virus WAtch
Week ending 17th January 2021

Key Points
It is important to note that the influenza and ILI surveillance systems in WA have been impacted by the COVID-19 pandemic. Therefore, interpretation of respiratory viral activity should be done with caution and take into account the effects of changes in health seeking behaviour including accessing alternate health services such as telehealth, focused testing for COVID-19 at COVID-19 clinics or specific acute respiratory infection clinics and the impact of physical distancing measures.

Influenza and influenza-like illnesses (ILI)
- **Summary**: Indicators of influenza activity remain below interseasonal levels.
- ILL activity at EDs* decreased over the past three weeks. ILI activity at sentinel GPs was in the lower range of levels usually seen at this time of year.
- There were no positive influenza samples reported by PathWest in the past week.
- RSV detections were higher than levels usually reported at this time of year.

Gastroenteritis
- Gastroenteritis presentations at sentinel GPs were below the range of values usually reported at this time of year. Presentations and admissions at EDs were also below baseline levels.
- PathWest laboratory detections of norovirus decreased in the past week, and rotavirus notifications remained at low levels.

Other vaccine-preventable diseases
- **Shingles and chickenpox**: Shingles presentations were above baseline levels at sentinel GPs and below baseline levels at EDs. Chickenpox presentations at EDs were at baseline levels in the past week.
- **Measles**: No measles cases were notified in the past week.
- **Mumps**: No mumps cases were notified in the past week.
- **Rubella**: No rubella cases were notified in the past week.
- **Invasive meningococcal disease (IMD)**: Two meningococcal cases, both serogroup B, were notified in the past week.

Other diseases
- **Coronavirus COVID-19**: As of 20 January 2021, a total of 888 COVID-19 cases have been confirmed in WA. See webpage for further information.

Virus WAtch is a weekly electronic publication by the Communicable Disease Control Directorate (CDCD) and key collaborators. It provides a brief summary of General Practice and Hospital Emergency Department sentinel surveillance data on influenza-like illness, gastroenteritis and varicella-zoster disease, together with relevant laboratory information, to alert health care workers in WA to important circulating viruses. All figures and data were accurate at time of publication, but subject to change. The data collections used to create this publication include:
- Sentinel General Practice (GP) data collected by WA members of the Australian Sentinel Practices Research Network (ASPREN)
- *Emergency Department (ED) data provided by the Emergency Department Information System (EDIS), which currently incorporates data from the following hospitals: Fiona Stanley Hospital, Sir Charles Gardiner Hospital, Royal Perth Hospital, Perth Children’s Hospital, King Edward Memorial Hospital, St John of God Midland, Bunbury Hospital, Armadale Hospital, Joondalup Health Campus, and Rockingham General Hospital.*
- Notification data derived from disease notifications received by CDCD, WA Department of Health from medical providers and public or private laboratories in WA. These data are updated routinely to include admission status for all public and public/private hospitals in WA and hospitalisation data are included in the report during the influenza season.
- Viral laboratory data obtained from PathWest laboratories at QEII Medical Centre, as well as via notification data sent by all WA laboratories to CDCD, WA Department of Health. As of 1 August 2020, daily reporting of COVID-19 cases include only confirmed cases diagnosed by nose and throat swabs. See webpage for further information.
Influenza and influenza-like illnesses

The rate of ILI presentations to sentinel GPs in the past week was in the lower range of levels usually reported at this time of year. There were no samples submitted for influenza testing by sentinel GPs in the past week. The rate of ILI presentations to EDs decreased over the past three weeks.

*This graph is a summary of current EDIS data using the ICD codes B34.9 and J06.9, which are consistent with a clinical presentation of a viral illness. This data may differ from that presented in the Winter Respiratory Illness Report provided by the Information and System Performance Directorate.
This graph is a summary of current EDIS data using the ICD codes B34.9 and J06.9 which are consistent with a clinical presentation of a viral illness. This data may differ from that presented in the Winter Respiratory Illness Report provided by the Information and System Performance Directorate.

Respiratory viral presentations to EDs decreased over the past three weeks and returned to the mid-range of levels usually reported at this time of year.

Influenza notifications reported to the Department of Health in the past week were below the seasonal threshold with no notifications received.
The graph is a summary of all WA samples reported by PathWest, excluding samples referred by other private laboratories for influenza subtyping.

The percentage of specimens positive for influenza virus at PathWest was below levels usually reported at this time of year. None of the 612 specimens submitted for influenza testing were positive for influenza in the past week.

**Influenza types and subtypes, 2020 to 2021**

The graph is a summary of all WA samples positive for influenza reported at PathWest, excluding samples referred by other private laboratories for influenza subtyping. *These samples were tested using a rapid testing method that does not determine the influenza subtype (i.e. influenza A/H3N2 or A/H1N1).*

No PCR positive influenza samples have been reported by PathWest since July 2020.
The graph is a summary of all WA samples positive for a common respiratory virus other than influenza reported at PathWest.

RSV increased well beyond usual levels from mid-November 2020 and reached a peak at the end of December 2020. RSV detections decreased in the past week but remained significantly higher than levels usually reported at this time of the year.

COVID-19 activity remains low in Western Australia. The majority of cases have been acquired overseas or at sea.
Gastroenteritis presentations to sentinel GPs were well below the range of values usually reported at this time of year.

This graph is a summary of current EDIS data for gastroenteritis presentations and admissions. Baseline levels for gastroenteritis presentations and admissions were calculated using the mean of weekly EDIS data from week 1, 2016 to week 52, 2020.

Gastroenteritis presentations and admissions to EDs in the past week were below baseline levels.
This graph is a summary of current EDIS data for gastroenteritis presentations.

The number of gastroenteritis presentations at EDs remained well below the range of values usually reported at this time of year.

Baseline levels for chickenpox and shingles presentations to WA ASPREN GPs per thousand consultations were calculated using the mean of weekly WA ASPREN data from week 1, 2016 to week 52, 2020.

Only one chickenpox presentation has been reported by sentinel GPs in the past eight weeks. Shingles presentations in the past week remained above baseline levels.
Baseline levels for varicella-zoster virus presentations were calculated using the mean of weekly EDIS data from week 1, 2016 to week 52, 2020.

Shingles presentations at EDs decreased in recent weeks and were below baseline levels in the past week. Chickenpox presentations at EDs remained stable at baseline levels.

This document can be made available in alternative formats on request for a person with disability.
