WEEK ENDING 1ST APRIL 2018

KEY POINTS

INFLUENZA AND INFLUENZA-LIKE ILLNESSES (ILI)
Summary: Influenza activity is currently at inter-seasonal levels.
- ILI presentations at sentinel GPs and EDs are fluctuating at low levels.
- Influenza notifications and PathWest laboratory detections and percent positivity remained low this week, following higher than expected interseasonal activity earlier this year.
- Non-influenza respiratory virus activity fell this week, driven by a decrease in RSV detections.

GASTROENTERITIS
- Gastroenteritis activity at sentinel GPs and EDs is currently around expected levels for this time of year.
- Rotavirus and norovirus activity remains low.

VARICELLA AND OTHER VACCINE-PREVENTABLE DISEASES
- Chickenpox and shingles activity at both sentinel GPs and EDs continues to fluctuate around baseline levels.
- Rubella: no cases have been confirmed in WA since two imported cases in early April 2017.
- Mumps: no further cases, since one confirmed locally acquired case, source unknown, was reported in the previous week. Five cases in total have been notified in 2018, to date.

MEASLES ALERT
No further cases reported in the past week. Four unrelated overseas-acquired infections were confirmed in WA residents during the latter half of March, with symptom onsets between 11th and 19th March (two infected in Bali, one in Malaysia and the other most likely in Thailand or Malaysia). People could potentially have been exposed to these cases at health-care facilities (including Bentley, Royal Perth and Joondalup Hospitals, GP surgeries, and pharmacies) and other sites around Perth. Secondary cases might present up until around mid-April. It is recommended that measles vaccine be considered for people travelling overseas, including to Bali, who were born after 1965 and who do not have documentation of having previously received two doses of measles vaccine. Current and archived issues of Virus Watch http://ww2.health.wa.gov.au/Articles/F_I/Infectious-disease-data/Virus-WAtch

Virus WAtch is a weekly electronic publication by the Communicable Disease Control Directorate (CDCD) and key collaborators. It provides a brief summary of General Practice and Hospital Emergency Department sentinel surveillance data on influenza-like illness, gastroenteritis and varicella-zoster disease, together with relevant laboratory information, to alert health care workers in WA to important circulating viruses. All figures and data were accurate at time of publication, but subject to change. The data collections used to create this publication include:
- Sentinel General Practice data collected by WA members of the Australian Sentinel Practices Research Network (ASPREN)
- Emergency Department data provided by the Emergency Department Information System (EDIS), which currently incorporates data from the following hospitals: Fiona Stanley Hospital, Sir Charles Gardiner Hospital, Royal Perth Hospital, Princess Margaret Hospital, King Edward Memorial Hospital, St John of God Midland, Bunbury Hospital, Armadale Hospital, Joondalup Health Campus, and Rockingham General Hospital.
- Notification data derived from disease notifications received by CDCD, WA Department of Health from medical providers and public or private laboratories in WA. These data are updated routinely to include admission status for all public and public/private hospitals in WA and hospitalisation data are included in the report during the influenza season.
- Viral laboratory data obtained from PathWest laboratories at QEII Medical Centre, as well as via notification data sent by all WA laboratories to CDCD, WA Department of Health.
Routine influenza detections remained low this week, whilst ILI presentations reported by WA ASPREN sentinel GPs increased slightly. One of the four samples (25%) submitted for influenza testing by sentinel GPs tested positive.

The rate of ILI presentations to WA ASPREN sentinel GPs increased this week, but remains at interseasonal levels.
The following is a summary of current Emergency Department sentinel surveillance (EDSS) data for respiratory viral presentations.

**Viral Respiratory ED Presentations and Admissions**

Respiratory viral presentations and admissions to sentinel EDs remained stable this week.

**ED Respiratory Viral Presentations, 2014-2018**

The number of respiratory viral presentations to sentinel EDs remained stable, and in the higher range of interseasonal levels.
The number of influenza notifications received by the Department of Health has declined over recent weeks and is at interseasonal levels.

The graph is a summary of all influenza notifications received by the DoH, Western Australia to the end of the current reporting week, for which cases had date of symptom onset or specimen collection between 26/03/2018 and 01/04/2018. The seasonal threshold defines a value above which indicates epidemic seasonal influenza activity. The threshold value is calculated based on analysis of seasonal influenza data from the past four years.

The percentage of specimens testing positive for influenza virus at PathWest is currently in the low to mid-range of values usually reported at this time of year. Of 140 specimens, 7 (5%) tested positive in the past week.

The graph is a summary of all WA routine and sentinel samples that have been processed by PathWest as of Wednesday 4th April 2018. This number does not include samples referred by other private laboratories for influenza subtyping.
Six routine samples were subtyped by PathWest during this reporting week; 5 (83%) influenza A/H1N1; and 1 (17%) influenza A/H3N2.

The graph is a summary of all WA routine samples that have been recorded as subtyped at PathWest as of Wednesday 4th April 2018. This number does not include sentinel samples or samples referred by other private laboratories for influenza subtyping.

Non-influenza respiratory virus activity fell this week, driven by a decrease in RSV detections after a small spike was reported last week.
The number of gastroenteritis presentations to sentinel GPs is in the lower-range of values usually seen at this time of year.

The following is a summary of current Emergency Department Sentinel Surveillance (EDSS) data for gastroenteritis presentations. Baseline levels for gastroenteritis presentations and admissions were calculated using the mean of weekly EDIS data from week 1, 2013 to week 52, 2017.

Gastroenteritis presentations and admissions to sentinel EDs remained below baseline level this week.
The number of gastroenteritis presentations to sentinel EDs remained low this week.

Rotavirus and norovirus activity remained low this week.
Chickenpox activity at WA ASPREN sentinel GPs was above baseline level this week, whilst shingles activity continues to fluctuate around the baseline.

Baseline levels for chickenpox and shingles presentations to WA ASPREN GPs per thousand consultations were calculated using the mean of weekly WA ASPREN data from week 1, 2013 to week 52, 2017.

The following is a summary of current Emergency Department sentinel surveillance (EDSS) data for varicella-zoster virus presentations.

Chickenpox and shingles presentations at sentinel EDs remained around baseline levels this week.

Baseline levels for varicella-zoster virus presentations were calculated using the mean of weekly EDIS data from week 1, 2013 to week 52, 2017.
