WEEK ENDING 15TH SEPTEMBER 2019

KEY POINTS

INFLUENZA AND INFLUENZA-LIKE ILLNESSES (ILI)

Summary: Indicators of influenza activity are below levels usually reported during the influenza season in WA.

- ILI activity at sentinel GPs and sentinel EDs decreased this week.
- PathWest influenza detections and test percent positivity are at low levels for this time of year.
- Influenza A accounted for the largest proportion of influenza detections at PathWest this week, with influenza A/H3N2 (35%) and influenza A/not subtyped* (57%), accounting for 92% of all samples, followed by influenza B (6%).
- Overall non-influenza activity decreased this week.

GASTROENTERITIS

- The number of gastroenteritis presentations to sentinel EDs was comparable to baseline levels this week.
- PathWest laboratory detections of norovirus and rotavirus remain at low levels.

OTHER VACCINE-PREVENTABLE DISEASES

- Shingles and chickenpox: Shingles and chickenpox activity at sentinel EDs was at or above baseline levels this week.
- Measles: No measles cases notified this week.
- Mumps: One mumps case notified this week.
- Rubella: No rubella cases notified this week.
- Invasive meningococcal disease (IMD): No meningococcal cases notified this week.

*these samples were tested using a rapid testing method that does not determine the influenza subtype (i.e influenza A/H3N2 or A/H1N1).
The number of routine PathWest influenza detections decreased this week. There was only one sample submitted for influenza testing by sentinel GPs this week.

The rate of ILI presentations this week is below levels usually reported during this time of year.

The following is a summary of current Emergency Department Sentinel Surveillance (EDSS) data for respiratory viral presentations.
While the total number of respiratory viral presentations to sentinel EDs this week remained relatively stable, the rate of presentations decreased.

The number of respiratory viral presentations to sentinel EDs remained stable this week and is lower than levels usually reported during the winter months, despite high levels reported earlier in 2019.

*The graph is a summary of presentations at Emergency Department Sentinel Surveillance (EDSS) sites using the ICD codes B34.9 and J06.9 which are consistent with a clinical presentation of a viral illness. This data may differ from that presented in the Winter Respiratory Illness Report provided by the Information and System Performance Directorate.
Influenza notifications in Western Australia by week, 2015 to 2019

Influenza notifications reported to the Department of Health decreased this week, and is consistent with past activity following a peak in notifications.

The graph is a summary of all influenza notifications received by the DoH, Western Australia to the end of the current reporting week, for which cases had date of symptom onset or specimen collection between 09/09/2019 and 15/09/2019. The seasonal threshold defines a value above which may indicate epidemic seasonal influenza activity. The threshold value is calculated based on analysis of seasonal influenza data from the past four years.

The percentage of specimens positive for influenza virus at PathWest remains below levels usually reported at this time of year. Of the 405 specimens, 17 (4%) tested positive in the past week.

The graph is a summary of all WA samples reported by PathWest, excluding samples referred by other private laboratories for influenza subtyping.
Seventeen positive samples were reported by PathWest this week comprising: 6 (35%) influenza A/H3N2, and 1 (6%) influenza B. Ten (57%) influenza A samples were not subtyped*.

The graph is a summary of all WA samples positive for influenza reported at PathWest, excluding samples referred by other private laboratories for influenza subtyping. *These samples were tested using a rapid testing method that does not determine the influenza subtype (i.e. influenza A/H3N2 or A/H1N1).

Overall non-influenza activity decreased this week, mostly due to a fall in parainfluenza and human metapneumovirus detections. Respiratory syncytial virus detections increased this week.

The graph is a summary of all WA samples positive for a common respiratory virus other than influenza reported at PathWest.
The number of gastroenteritis presentations to sentinel GPs is higher than the values normally reported at this time of year.

**Gastroenteritis presentations to sentinel EDs were comparable to baseline levels this week.**

This graph is a summary of current EDIS data for gastroenteritis presentations and admissions. Baseline levels for gastroenteritis presentations and admissions were calculated using the mean of weekly EDIS data from week 1, 2014 to week 52, 2018.
The number of gastroenteritis presentations to sentinel EDs remains in the mid-range of values normally reported at this time of year.

**ED gastroenteritis presentations 2015 to 2019**

The number of gastroenteritis presentations to sentinel EDs remains in the mid-range of values normally reported at this time of year.

**Viral Rashes**

**GP varicella-zoster virus presentations**

Shingles and chickenpox activity reported by WA ASPREN GPs was below baseline levels this week.

Baseline levels for chickenpox and shingles presentations to WA ASPREN GPs per thousand consultations were calculated using the mean of weekly WA ASPREN data from week 1, 2014 to week 52, 2018.
The following is a summary of current Emergency Department sentinel surveillance (EDSS) data for varicella-zoster virus presentations.

**ED Varicella-Zoster virus Presentations**
