Week ending 2nd February 2020

**Key Points**

**Influenza and influenza-like illnesses (ILI)**
- **Summary:** Indicators of influenza activity were generally above levels usually reported during this time of the year in WA.
- ILI activity at sentinel GPs this week was in the lower range of levels usually reported.
- ILI presentations at sentinel EDs increased in the past week, while admissions decreased.
- PathWest influenza detections and test percent positivity were higher than levels usually reported at this time of year.
- Influenza A accounted for 94% of influenza detections at PathWest in the past week, comprising 59% influenza A/H1N1, 9% A/H3N2 and 25% were influenza A/not subtyped. Influenza B accounted for 6% of influenza detections.
- Overall non-influenza activity remained relatively stable in the past week.

**Gastroenteritis**
- The rate of gastroenteritis presentations to sentinel GPs was in lower levels normally reported at this time of year and the number of presentations and admissions to sentinel EDs was higher than baseline levels.
- PathWest laboratory detections of norovirus remained relatively stable in the past week, and rotavirus remained at low levels

**Other vaccine-preventable diseases**
- **Shingles and chickenpox:** There were no chickenpox presentations to sentinel GPs in the past week and the number of presentations to sentinel EDS was lower than baseline levels. The rate of shingles presentations at sentinel GPs and sentinel EDs was higher than baseline levels.
- **Measles:** One measles case was notified in the past week.
- **Mumps:** No mumps cases were notified in the past week.
- **Rubella:** No rubella cases notified in the past week.
- **Invasive meningococcal disease (IMD):** No meningococcal cases were notified in the past week.
Influenza and influenza-like illnesses

The number of routine PathWest influenza detections decreased in the past week and there was one detection among the samples submitted for influenza testing by sentinel GPs.

The rate of ILI presentations to sentinel GPs this week was in the lower range of levels usually reported during this time of year.
The following is a summary of current Emergency Department Sentinel Surveillance (EDSS) data for respiratory viral presentations.

Respiratory viral presentations to sentinel EDs increased in the past week while admissions decreased.

The number of respiratory viral presentations to sentinel EDs increased in the past week and was well above levels usually reported during this time of year.

*The graph is a summary of presentations at Emergency Department Sentinel Surveillance (EDSS) sites using the ICD codes B34.9 and J06.9 which are consistent with a clinical presentation of a viral illness. This data may differ from that presented in the Winter Respiratory Illness Report provided by the Information and System Performance Directorate.
Influenza notifications reported to the Department of Health in the past week was above the seasonal threshold.

The graph is a summary of all influenza notifications received by the DoH, Western Australia to the end of the current reporting week, for which cases had date of symptom onset or specimen collection between 27/01/2020 and 02/02/2020. The seasonal threshold defines a value above which may indicate epidemic seasonal influenza activity. The threshold value is calculated based on analysis of seasonal influenza data from the past four years.

The percentage of specimens positive for influenza virus at PathWest was higher than levels usually reported at this time of year. Of 237 specimens submitted, 32 (14%) tested positive in the past week.
The graph is a summary of all WA samples reported by PathWest, excluding samples referred by other private laboratories for influenza subtyping.

Thirty two positive samples were reported by PathWest in the past week, of which 30 were influenza A and two were influenza B. Of the 30 influenza A cases, 19 were A/H1N1, three were A/H3N2 and eight were not subtyped.

The graph is a summary of all WA samples positive for influenza reported at PathWest, excluding samples referred by other private laboratories for influenza subtyping. * These samples were tested using a rapid testing method that does not determine the influenza subtype (i.e. influenza A/H3N2 or A/H1N1).

The overall non-influenza activity increased in the past week.

The graph is a summary of all WA samples positive for a common respiratory virus other than influenza reported at PathWest.
The rate of gastroenteritis presentations to sentinel GPs decreased in the past week and was below levels normally reported at this time of year.

Gastroenteritis presentations and admissions to sentinel EDs in the past week were higher than baseline levels.

This graph is a summary of current EDIS data for gastroenteritis presentations and admissions. Baseline levels for gastroenteritis presentations and admissions were calculated using the mean of weekly EDIS data from week 1, 2014 to week 52, 2018.
The number of gastroenteritis presentations to sentinel EDs decreased in the past week and is within the range of values normally reported at this time of year.

**Viral rashes**

There were no chickenpox presentations reported by WA ASPREN GPs in the past week and the rate of shingles presentations was higher than baseline levels.

Baseline levels for chickenpox and shingles presentations to WA ASPREN GPs per thousand consultations were calculated using the mean of weekly WA ASPREN data from week 1, 2014 to week 52, 2018.
The following is a summary of current Emergency Department sentinel surveillance (EDSS) data for varicella-zoster virus presentations.

Chickenpox presentations to sentinel EDs in the past week were lower than baseline levels, and the shingles presentation rate was higher.

Baseline levels for varicella-zoster virus presentations were calculated using the mean of weekly EDIS data from week 1, 2014 to week 52, 2018.
